

ABSTRACT OF THE DISCLOSURE

A cellular communication apparatus utilizes an antenna and control logic. The control logic is configured to monitor cellular signals detected by the antenna. The cellular signals are transmitted from cellular devices and identify the cellular devices.

- 5 The control logic is further configured to receive a request to transmit to a remote cellular device and to make a determination, in response to the request, as to whether the remote cellular device is identified by one of the cellular signals detected by the antenna. The control logic is further configured to transmit a cellular signal based on the determination.
